

FOTOCAL

COLOUR LASER COPIER DECAL PAPER

TPL 800

FotoCal is a revolutionary decal paper that can be printed using a Canon, Xerox, Ricoh or Minolta Colour Laser Copier. The finished decal can be applied to uncoated ceramics, metal plastic, wax wood and glass.

1. Peel away the tissue protector sheet from the paper. Image FotoCal in your CLC using the bypass tray using the normal paper mode so as to insure the shiny side should receive the print toner image.

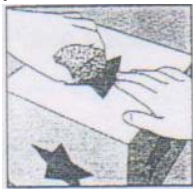

2. Cut around the edge of the design using normal scissors. You may cut as close to the design as possible leaving a slight paper border.

3. Soak the cut decal in a suitably sized container of room temperature lukewarm water. The transfer will begin to curl. Once the curling has started rub the transfer between your fingers to release. The film should release from the paper.

4. Once it begins to release from the paper, carefully slide the design from the backing paper onto the surface you have chosen to decorate.

5. Gently wipe over the entire surface of the decal with a wet sponge or a squeegee to smooth out (expelling all air bubbles) the decal. Be careful not to break or move the decal.

6. Remove the remaining water from the surface with a clean soft facial tissue. Allow 2 hours for the decal to dry before handling. In very high humidity this drying process may take longer. Once the decal is dry the surface may be finished with polyurethane varnish, epoxy or acrylic paint. On ceramic the finished product can be baked in an oven at 280°F (140°C) for up to 20 minutes to improve durability. Remember the ceramic will be very hot to the touch. Be prepared with the appropriate handling device so as not to sustain burns.
